

hopptx

Generate PowerPoint presentations from Calendly sign-up data.

Setup (one time)

Install UV, a small tool that manages Python for you:

<https://docs.astral.sh/uv/getting-started/installation/>

Usage

Open the hopptx folder and double-click:

- **Windows:** `run.bat`
- **Mac:** `run.command`

A black terminal window will briefly appear behind the app: that's normal, it's just how Windows launches the program, and you can ignore it (don't close it, or the app will close too). The actual window you'll use looks like a regular program window:

1. Click **"Select Files..."** and pick your Excel report(s), you can select multiple `.xlsx` files at once.
2. Pick a start and end date from the calendar date pickers.
3. Click **"Generate Presentations"**, progress is shown right in the window.
4. When done, the output folder opens automatically with one PowerPoint per company.

If something goes wrong, an error message pops up. A detailed log file is always saved alongside the output (use the "View Log" button to open it).

Excel file format

Each `.xlsx` file represents one company. The first sheet name becomes the company name in the presentation.

The following columns are required (extra columns are fine and will be ignored):

Column	Description
User Name	Calendly user who owns the event
Team	Team the user belongs to
Invitee Name	Full name of the person who signed up
Invitee First Name	First name
Invitee Last Name	Last name
Invitee Email	Email address
Event Type Name	Name of the training/workshop
Start Date & Time	When the session starts
Event Created Date & Time	When the sign-up was created

Canceled

Whether the sign-up was canceled

Advanced usage

For more control, you can edit `config/runs.json` directly and run:

```
uv run hopptx default
```

See `config/runs.json` for all available options (date range, cost per training, topic grouping, etc.).

Generate this README as PDF

```
uv run --extra docs python build_readme_pdf.py
```

This creates `README.pdf` in the project folder.

Tests

```
uv run pytest
```
